

Livestock Watering System

Description

Selectively placed watering troughs can make pasture management easier. Farmers can control grazing more efficiently and prevent erosion and water pollution by excluding livestock from streams, springs, and other environmentally sensitive water sources.

Benefits

- Provides a clean, reliable, and easily accessible water supply for animals.
- Allows farmers to divide large pastures into smaller units and rotate livestock from one pasture to another to maintain good forage quality.
- Can help reduce erosion from messy or muddy areas resulting from livestock having uncontrolled access to springheads or streams.
- Can reduce mastitis or hoof problems by providing water for livestock in dry pastures.
